DECLARATION

I hereby declare that the project report entitled "CRICKSTATS – Cricket Player Performance Tracking Application" is prepared by me as part of my academic project work. The project demonstrates the use of Salesforce Administration features to design a structured application for recording, managing and analysing cricket player performance data.

I further declare that the work presented in this report is prepared for academic purposes and that the implementation details, screenshots and test records will correspond to the Salesforce org used for the project.

ACKNOWLEDGEMENT

I express my sincere gratitude to the management of [COLLEGE NAME] and the Department of [DEPARTMENT] for providing the opportunity and facilities to complete this project.

I thank my project guide and faculty members for their valuable guidance, suggestions and encouragement throughout the development of CRICKSTATS. Their support helped me understand Salesforce Administration concepts and apply them in a practical project.

I also thank my classmates, friends and family members for their continuous support during the preparation, configuration, testing and documentation of the application.

Finally, I thank Salesforce learning resources and documentation that helped in understanding Lightning applications, custom objects, relationships, Flow automation, reports and dashboards.

ABSTRACT

CRICKSTATS is a Salesforce-based Cricket Player Performance Tracking Application designed to centralize
player and match-performance information in a cloud environment. Traditional performance records can be
difficult to maintain when information is distributed across spreadsheets, notebooks or separate files.
CRICKSTATS provides a structured Salesforce data model so that player profiles and match-wise
performance can be recorded consistently.

The application uses custom objects such as Player and Match Performance, supported by fields,
relationships, validation rules, Lightning pages, Flow automation, reports and dashboards. The solution is
intended for administrators, coaches, analysts and team managers who need organized performance
information.

The project demonstrates how Salesforce Administration can be used to build a practical business application
without requiring a separate database server. By combining centralized data management and analytics,
CRICKSTATS can support easier record retrieval, reporting and performance review.

Keywords: Salesforce, Administrator, Cricket, Player Performance, Custom Objects, Flow, Reports,
Dashboard, Cloud CRM.

1. INTRODUCTION

1.1 Project Overview

CRICKSTATS is a cloud-based Salesforce application created to manage cricket player profiles and
match-by-match performance records. The system provides a single location to store player information,
match details and performance statistics.

The application follows a simple Salesforce architecture: users interact with the Lightning interface, records
are stored in custom objects, business rules are applied through configuration and automation, and
reports/dashboards convert stored data into useful information.

1.2 Background

Cricket performance involves many measurable indicators such as matches played, runs, wickets, catches,
strike rate, batting average and bowling economy. When these values are maintained manually, updating and
comparing records can become time-consuming. A structured cloud application can reduce repetitive work
and improve accessibility.

1.3 Purpose

- Digitize player performance records.
- Maintain match-wise statistics in a centralized system.
- Reduce manual calculation and duplicate data entry.
- Provide reports and dashboards for performance analysis.
- Use Salesforce automation to improve data consistency.
- Provide a scalable foundation for future analytics.

1.4 OBJECTIVES & SCOPE

Objectives

- Create a Salesforce application named CRICKSTATS.
- Create custom Player and Match Performance objects.
- Configure relevant fields and relationships.
- Use validation to reduce incorrect data entry.
- Automate selected updates using Salesforce Flow.
- Create reports for player and match analysis.
- Create a dashboard containing key performance indicators.
- Test the application using sample records.

Scope of the Project

The project focuses on administration and configuration features available within Salesforce. The initial scope includes player master data, match-wise performance, navigation, data validation, automation, reports and dashboards. Advanced features such as external API integration, machine-learning prediction and ball-by-ball live scoring are considered future enhancements.

Target Users

User	Main Responsibility
Salesforce Administrator	Configure objects, fields, security, automation and reports.
Coach	Review player and match performance.
Team Manager	Maintain team and player information.
Analyst	Use reports and dashboards for performance review.
Player	View relevant performance information where access is provided.

2. IDEATION PHASE

2.1 Problem Statement

Problem	User	Need	Current Difficulty
PS-1	Coach	Track performance across matches	Recordsmaybespreadacrossfilesandform
PS-2	Team Manager	Maintain complete player records	Manual updating consumes time.
PS-3	Analyst	Comparetrendsandgeneratereport	sScattereddatamakescomparisondifficult.
PS-4	Administrator	Maintain data quality	Incorrectorincompleteentriesmayaffectsta

2.2 User Story

As a Salesforce Admin , I want to create a comprehensive player performance tracking application in Salesforce so that player and match information can be stored systematically, validated, automated and analysed through reports and dashboards.

2.3 Key Questions

• How can player details be stored in a structured Salesforce object?

• How can match-wise performance be related to a player?

• How can incorrect scores or missing values be prevented?

• How can summary statistics be displayed quickly?

• How can the system support future growth in players and matches?

2.4 EMPATHY MAP

Target Users

• Team Managers

• Coaches

• Performance Analysts

• Salesforce Administrators

Aspect	User Perspective
Think & Feel	Need accurate, accessible and trustworthy performance information.
See	Player profiles, match statistics, reports and visual dashboard metrics.
Hear	Feedback from coaches, analysts and team management.
Say & Do	Enter match records, review performance and generate reports.
Pain Points	Manual data entry, duplicate records, difficult comparisons and delayed reporting.
Needs	Centralized storage, validation, automation and easy analytics.

Proposed Value

CRICKSTATS converts fragmented performance information into a structured Salesforce data model. The application is intended to make information easier to enter, retrieve and analyse while providing a foundation

for future automation and analytics.

3. REQUIREMENTS & FEASIBILITY

3.1 Functional Requirements

• Create and maintain Player records.

• Create Match Performance records.

• Associate performance records with players.

• Capture batting, bowling and fielding statistics.

• Validate important numerical and mandatory fields.

• Generate reports using stored records.

• Display key metrics in dashboards.

• Automate selected calculations or updates using Flow.

3.2 Non-Functional Requirements

• Usability: simple Lightning navigation and clear field labels.

• Reliability: consistent validation and controlled data entry.

• Security: Salesforce permissions and access controls.

• Scalability: cloud data model can grow with additional records.

• Maintainability: configuration-based components are easier to update.

3.3 Hardware / Software Requirements

Category	Requirement
Device	Laptop/Desktop with modern browser
Browser	Chrome / Edge / Firefox or supported browser
Platform	Salesforce Lightning Experience
Internet	Required for Salesforce cloud access
Account	Salesforce Developer / training org
Tools	Object Manager, Flow Builder, Reports, Dashboards

3.4 FEASIBILITY STUDY

Technical Feasibility

The project is technically feasible because Salesforce provides custom objects, fields, relationships,
validation, automation, reports and dashboards as platform capabilities. The application can therefore be
configured using declarative administration features.

Economic Feasibility

For an academic prototype, a Salesforce Developer or training environment can be used. This reduces the
need to build and maintain separate database and application infrastructure. Production deployment costs
would depend on the Salesforce edition, number of users and required features.

Operational Feasibility

The proposed interface is based on standard Lightning components and familiar record-management
concepts. Users can create records, view related information and access reports through a centralized
application.

3.5 Technology Stack

Layer	Technology / Salesforce Feature
Presentation	Salesforce Lightning Experience
Data	Custom Objects and Fields
Relationships	Lookup / Master-Detail as appropriate
Automation	Salesforce Flow
Analytics	Reports and Dashboards
Cloud Platform	Salesforce Platform

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

Manual cricket records can create problems in updating, searching and comparing player performance. CRICKSTATS addresses these issues by storing information in structured Salesforce objects. Validation reduces incorrect inputs, relationships connect performance records with players, and reports/ dashboards

provide organized views of stored information.

4.2 Proposed Solution

• Player custom object for player master information.

• Match Performance custom object for match-wise statistics.

• Relationship between player and performance records.

• Validation rules for important inputs.

• Flow automation for selected business logic.

• Lightning application for navigation.

• Reports and dashboards for analytics.

4.3 Solution Architecture

Layer	Components	Purpose
Presentation	Lightning App / Record Pages	User interaction and navigation
Application	Flow / Validation / Configuration	Business rules and automation
Data	Player / Match Performance	Centralized performance information
Analytics	Reports / Dashboards	Summaries and visual insights

4.4 DATA MODEL

The core data model contains two primary custom objects. The Player object stores stable information about
a player. The Match Performance object stores statistics for a particular match or performance entry.

Object	Important Fields	Purpose
Player	PlayerName,Team,Role,BattingStyle,BowlingSt	yle,MatchesPlayed
Match Performance	Player,MatchDate,MatchType,Runs,Wickets,Ca	tches,StrikeRate,EconomyRate
Optional Team	Team Name, Coach, Season	Canbeaddedforteam-levelorga

4.5 Relationship Concept

A Player can have multiple Match Performance records. This represents a one-to-many relationship. The
exact relationship type can be selected based on the required data ownership and reporting behaviour.

4.6 Data Flow

User →Lightning UI →Player / Match Performance →Validation & Flow →Reports →Dashboard

4.7 FIELD DESIGN

Field	Type	Example / Rule
Player Name	Text	Required
Team	Picklist	Team selection
Role	Picklist	Batsman / Bowler / All-Rounder / Wicketkeeper
Batting Style	Picklist	Right-hand / Left-hand
Bowling Style	Picklist	Fast / Spin / Not Applicable
Matches Played	Number	Non-negative
Match Date	Date	Valid match date
Match Type	Picklist	Test / ODI / T20 / Domestic
Runs	Number	Non-negative
Wickets	Number	Non-negative
Catches	Number	Non-negative
Strike Rate	Number	Calculated / entered as required
Economy Rate	Number	Used mainly for bowling analysis

4.8 Validation Examples

- Runs should not be negative.
- Wickets should not be negative.
- Matches Played should not be negative.
- Required player information should not be left blank.
- Numeric values should stay within reasonable project-defined limits.

5. PROJECT PLANNING & SCHEDULING

5.1 Development Methodology

An Agile-style sprint approach is suitable for the project. Development is divided into small increments: setup, data modeling, navigation, UI, automation, analytics and testing.

5.2 Product Backlog

Sprint	US	User Story / Task	Priority	Points
1	US-1	Create Salesforce environment and application	High	2
1	US-2	Create Player and Match Performance objects	High	3
2	US-3	Create fields and relationships	High	5
2	US-4	Configure Lightning navigation and page layouts	High	3
2	US-5	Create validation rules	Medium	3
3	US-6	Create Flow automation	High	5
3	US-7	Create reports and dashboard	High	5
4	US-8	Testing, corrections and documentation	High	5

5.3 SPRINT SCHEDULE

Sprint	Duration	Planned Activities	Deliverable
Sprint 1	1 Week	Org setup, app creation, objects	Basic data model
Sprint 2	1 Week	Fields, relationships, layouts, validation	Working data entry
Sprint 3	1 Week	Flow, reports, dashboard	Automated analytics
Sprint 4	1 Week	Testing, corrections, documentation	Final project

5.4 Project Tracker

Milestone	Status	Evidence
Salesforce setup	Completed / Update	Setup screen
Objects and fields	Completed / Update	Object Manager screenshots
Relationships	Completed / Update	Field relationship screen
Lightning App	Completed / Update	App navigation screenshot
Automation	Completed / Update	Flow Builder screenshot
Reports	Completed / Update	Report screenshot
Dashboard	Completed / Update	Dashboard screenshot
Testing	Completed / Update	Test case results

6. PROJECT DEVELOPMENT PHASE

Milestone 1 – Salesforce Environment

Create or open the Salesforce training/developer environment. Verify that Lightning Experience is available

and open Setup from the gear menu.

Milestone 2 – Create the CRICKSTATS App

Create a Lightning application named CRICKSTATS. Configure navigation items such as Home, Players, Match Performances, Reports and Dashboards.

Milestone 3 – Player Object

• Open Setup →Object Manager.

• Select Create →Custom Object.

• Label: Player; Plural Label: Players.

• Configure the record name as Player Name.

• Enable reporting where required.

• Save the object.

Milestone 4 – Match Performance Object

• Create a custom object named Match Performance.

• Configure the record name.

• Enable reporting.

• Add fields for match date, match type and performance statistics.

• Create the relationship to Player.

6.1 CONFIGURING FIELDS & RELATIONSHIPS

After creating the objects, add fields according to the project data model. Picklists are useful for fixed
categories such as role, team and match type. Number fields are used for statistics such as runs, wickets and
catches.

Relationship Configuration

Create the Player relationship on Match Performance. When a performance record is created, the user can
select the corresponding player. This allows reports to group match performance by player.

Page Layout

- Arrange identity fields first.
- Place match details together.
- Place batting, bowling and fielding statistics in logical sections.
- Mark important fields as required where appropriate.
- Remove irrelevant fields from the user-facing layout.

Data Quality

Validation rules should be used for values that must follow a business condition. For example, a rule can
prevent a negative run or wicket value. Validation should be tested with both valid and invalid sample records.

6.2 LIGHTNING APP & NAVIGATION

The CRICKSTATS Lightning application acts as the main entry point for users. Navigation items can be configured so that the most important records and analytics are easy to access.

Navigation Item	Purpose
Home	Application landing page and important components.
Players	Create and view player records.
Match Performances	Create and view match-wise statistics.
Reports	Access analytical reports.
Dashboards	View visual performance summaries.

Screenshot Placeholder

[INSERT SCREENSHOT: CRICKSTATS LIGHTNING APP HOME PAGE HERE]

6.3 FLOW AUTOMATION

Salesforce Flow can be used to automate repetitive tasks. For CRICKSTATS, a record-triggered flow can be
designed to perform a defined update whenever a Match Performance record is created or changed.

Example Flow – Player Statistics Update

Step	Flow Action
1	Start when a Match Performance record is created/updated.
2	Get the related Player record.
3	Read relevant performance values.
4	Calculate or prepare required summary values.
5	Update the Player record if the selected design requires stored summaries.
6	Save and activate the flow.
7	Create test records and verify the result.

The exact Flow logic should match the fields actually created in the Salesforce org. If summary values are
calculated through reports, the Flow can be kept simpler.

7. REPORTS, DASHBOARDS & ANALYTICS

7.1 Reports

• Player Master Report – lists player profile information.

• Match Performance Report – lists match-wise statistics.

• Top Run Scorers Report – groups players by runs.

• Bowling Performance Report – displays wickets and economy-related fields.

• Team Performance Report – groups records by team.

7.2 Dashboard Components

Component	Purpose
Total Players	Shows the number of player records.
Total Performance Records	Shows the number of match-performance entries.
Runs by Player	Visual comparison of stored runs.
Wickets by Player	Visual summary of wickets.
Performance by Match Type	Shows distribution across match categories.
Recent Performances	Displays latest entered records.

7.3 DASHBOARD DESIGN

The dashboard is intended to give a quick overview of the data stored in CRICKSTATS. Each chart should be
connected to a report containing the required fields.

Suggested Layout

Position	Component
Top	Total Players | Total Matches / Performance Records
Middle	Runs by Player | Wickets by Player
Bottom	Performance by Match Type | Recent Performance Table

Screenshot Placeholder

[INSERT SCREENSHOT: CRICKSTATS DASHBOARD HERE]

Interpretation

The dashboard provides a quick visual summary, while detailed reports can be opened when record-level
information is required.

7.4 DATA SECURITY & ADMINISTRATION

Salesforce provides administrative controls for managing access to objects, fields and records. The CRICKSTATS application should use only the access required by each project user.

• Use profiles or permission sets to control object permissions.

• Restrict sensitive fields where necessary.

• Use appropriate record access settings.

• Avoid exposing unnecessary administrative functions to normal users.

• Use field history tracking where useful for important data changes.

• Test access with appropriate user profiles before deployment.

7.5 DATA QUALITY PRACTICES

• Use picklists for controlled categories.

• Use validation rules for numerical constraints.

• Use meaningful field labels and help text.

• Avoid duplicate player records.

• Review test data before generating final screenshots.

8. FUNCTIONAL & PERFORMANCE TESTING

Testing verifies that the configured objects, fields, validation rules, flows, reports and dashboards behave as

expected. Both positive and negative test cases should be performed.

TC ID	Test Case	Expected Result	Status
TC-01	Create valid Player record	Record is saved successfully	Pass / Update
TC-02	Create valid Match Performance	Record is saved and related to Player	Pass / Update
TC-03	Enter negative runs	Validation prevents save	Pass / Update
TC-04	Enter negative wickets	Validation prevents save	Pass / Update
TC-05	Run automation	Configured Flow executes correctly	Pass / Update
TC-06	Open Player report	Player records are displayed	Pass / Update
TC-07	Open dashboard	Charts and metrics load correctly	Pass / Update
TC-08	Search/filter records	Relevant records are displayed	Pass / Update

8.1 PERFORMANCE TESTING & SCREENSHOTS

Performance is reviewed from the user's perspective by checking record-save response, report loading and dashboard loading. The project should be tested with multiple sample records so that grouping and reporting

can be verified.

• Create several Player records.

• Create several Match Performance records for different players.

• Open reports and verify totals and groupings.

• Open the dashboard and verify that visual components reflect the test data.

• Edit a performance record and confirm that configured automation behaves correctly.

• Check that validation rules still work after edits.

8.2 Screenshot Checklist

• Salesforce Setup / Object Manager

• Player Object fields

• Match Performance fields

• Relationship field

• Lightning App navigation

• Flow Builder

• Report

• Dashboard

• Sample Player record

• Sample Match Performance record

9. ADVANTAGES & DISADVANTAGES

9.1 Advantages

• Centralized storage of player and performance information.

• Cloud-based access through Salesforce.

• Reduced manual calculation and repetitive work.

• Reports and dashboards provide quick summaries.

• Validation helps maintain data quality.

• Flow supports automation of defined business processes.

• The data model can be extended with additional objects and fields.

9.2 Disadvantages / Limitations

• Internet access is generally required for cloud usage.

• Salesforce licensing and feature availability depend on the chosen edition.

• The initial application depends on accurate data entry.

• Advanced ball-by-ball analysis requires additional data design.

• External live-score integration is outside the basic scope.

9.3 Risk Mitigation

• Use validation rules to reduce incorrect entries.

• Use permissions to control access.

• Test automation before activation.

• Maintain consistent naming conventions.

• Back up or export data according to organizational requirements.

10. CONCLUSION & FUTURE SCOPE

10.1 Conclusion

CRICKSTATS demonstrates how Salesforce Administration can be applied to a real-world cricket performance management scenario. The project organizes player and match-performance information using

custom objects, fields and relationships. Lightning application configuration provides navigation, while validation and Flow support controlled data management. Reports and dashboards provide a convenient way to view and analyse stored statistics.

The project also demonstrates practical understanding of cloud CRM concepts, declarative configuration, data modeling, automation and analytics. With appropriate sample data and screenshots from the actual Salesforce org, the application can serve as an academic demonstration of Salesforce administration skills.

10.2 Future Scope

- Mobile-friendly enhancement for coaches and players.
- Integration with external cricket score APIs.
- Ball-by-ball performance object and innings-level analytics.
- AI-assisted performance trend analysis.
- Player comparison and ranking dashboards.
- Season and tournament management.
- Video-analysis integration.
- Multi-team and multi-league support.
- Notification automation for selected performance events.

11. APPENDIX

A. Sample Player Data

Player Name	Team	Role	Matches
Player A	Team Alpha	Batsman	12
Player B	Team Alpha	Bowler	10
Player C	Team Beta	All-Rounder	15
Player D	Team Beta	Wicketkeeper	11

B. Sample Match Performance

Player	Match Type	Runs	Wickets	Catches
Player A	T20	72	0	1
Player B	T20	8	3	0
Player C	ODI	64	2	1
Player D	T20	45	0	2

C. Evidence to Attach

• Salesforce application home page.

• Player object configuration.

• Match Performance object configuration.

• Fields and relationships.

• Validation rule screens.

• Flow configuration.

• Reports.

• Dashboard.

• Sample records.

• Final testing evidence.
